CYTOLOGY REPORT

PAP Smear (Liquid Based Cytology)

Smears are well preserved, evenly spread.

Staining of cells & background is satisfactory.

Microscopic description – Smears are satisfactory for evaluation.

Smear shows ectocervical cells with mild dysplasia (enlarged nuclei with uneven margins & high N/C ratio).

Background shows inflammation.

Impression: Cytology favours Low-grade squamous intraepithelial lesion.

(According to New Bethesda system (2023) for reporting Cervical Cytology).

CYTOLOGY REPORT

PAP Smear (Liquid Based Cytology)

Smears are well preserved, evenly spread.

Staining of cells & background is satisfactory.

Microscopic description – Smears are satisfactory for evaluation.

Cervical cells are atrophic & shows degeneration.

There are fungal spores present in the background.

No atypia seen in the smear.

Impression: Menopausal smear , Negative for intraepithelial lesion/malignancy.

(According to New Bethesda system (2023) for reporting Cervical Cytology).

Pap Smear Test Report

ADEQUACY OF SMEAR

Satisfactory for evaluation. Transformation zone elements are identified.

GENERAL CATEGORY OF SMEAR

Negative for intraepithelial lesion or malignancy - Atrophic smear.

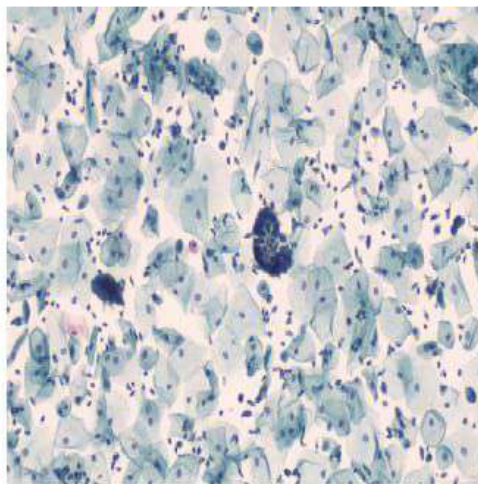

DESCRIPTION OF SMEAR

Smears studied show intermediate squamous epithelial cells with parabasal cells, metaplastic squamous cells and endocervical cell clusters. Background shows bare nuclei with scattered neutrophils. Smears are negative for intraepithelial lesion or malignancy.

Site Examined

Cervix
